SE 226 – LAB#3 2025-2026 SPRING

Aim: C++: Practice with pointers.

In Week 4, you have learned how pointers work in C++. You have seen how variables can be accessed through memory addresses, how values can be modified using pointers, and how arrays can be traversed with pointer arithmetic.

The functions to implement:

- **swapValues(int* p1, int* p2)** : Swaps the values of two integers using pointers.
- **printArray(int* arr, int size)** : Prints the elements of an array using **pointer notation**.
- **findMax(int* arr, int size)** : Returns the maximum element of the array.
- **reverseArray(int* arr, int size)** : Reverses the order of elements in the array.
- **createArray(int size)** : Dynamically creates an integer array and returns its address.
- **deleteArray(int* arr)** : Frees the dynamically allocated memory.

SAMPLE OUTPUT

```
Creating dynamic array...

Enter array size: 5
Enter values: 4 7 1 9 3

Array elements:
4 7 1 9 3

Maximum element: 9
---------------------------------
Swapping two numbers

Before swap
a = 5
b = 8

After swap
a = 8
b = 5
---------------------------------
Reversing array...

Array after reverseArray:
3 9 1 7 4
---------------------------------
Deleting array...
Memory released successfully.
```
